Better Communication in Alzheimer's Care

Communication refers to the ability to speak, understand speech, read, write, and gesture. It is how we make contact with each other. Nonverbal messages are given through silence, body movements, or facial expressions. As much as 90 percent of our communication is nonverbal. Be aware that words can carry one message and the body another; people with dementia seem to be especially sensitive to the tone or feeling of your communication and that is what they will react to.

"Aphasia" (a-fa-zha) is a word for problems with language: it can affect speaking, understanding speech, reading, and writing. Aphasia is one of the problems associated with Alzheimer's disease (AD). In the early stages of the disease, people have trouble thinking of common words while speaking or writing. In time, the ability to understand what others are saying also declines. While people with AD continue to be able to read, they eventually do not understand what they are reading. Communication problems become progressively worse over the course of the illness, until verbal communication becomes virtually impossible.

Tips for Better Communication

- Keep good eye contact.
- Don't interrupt or distract the person while they are talking.
- Avoid criticizing, correcting and arguing.
- Focus on the feelings, not the facts.
- Approach the person from the front. Tell them who you are.
- Call the person by name.
- Use short, simple words and sentences.
- Ask one question at a time.
- Repeat information and questions. If the person doesn't respond, wait a moment. Then ask again. Try to rephrase and use other words.
- Avoid quizzing. "Do you remember when...?"
- Break down instructions into clear, simple steps.

(continued on Page 2)

Better Communication...continued from Page 1

- Avoid confusing expressions. If you ask the person to “Hop in!” He or she may take that as a literal instruction. Describe the action directly to prevent confusion. “Please come here. Your shower is ready.”
- Avoid vague words. Instead of saying “Here it is!” - try saying, “Here is your sweater.”
- Turn negatives into positives. Instead of saying, “Don’t go there” try, “Lets go to the dining room.”
- Give visual cues. To help demonstrate the task, while asking them to do the task, point or touch the item you want the person to use. Or, begin the task for the person.

Communication Problems and Solutions at Each Alzheimer’s Disease Stage

Early Stage – Trouble Using and Understanding Words

- Difficulty finding the right word to say or using familiar words repeatedly.
- Lose their train of thought or take long pauses between words.
- Have difficulty following conversations when there are many speakers.
- Since memory for recent events has declined, they may repeat themselves because they don’t remember that they have already said something.

Help a person in the early stage have confidence to use their remaining verbal skills. Gently suggest the word they cannot find or remind them of what they were trying to say when they lose their trend of thought. If they prefer time to come up with the missing word or idea on their own, wait patiently.

Middle Stage – Trouble Expressing Feelings and Needs

- Trouble sticking to a subject or forgetting what they were intending to say.
- May use pat phrases that sound like regular social dialogue, but cover up an inability to say more complex things. “Hello how are you? You look real good” may be repeated to each person they meet.

Avoid calling attention to memory problems and embarrassing them. As the illness progresses, it will have an impact on many aspects of daily life. Communication difficulties may appear more severe because the person may have hearing and vision loss as well as problems with judgment, impulse control, and planning. They may speak loudly on the bus, approach strangers as if they were long-lost relatives, and ask you why that lady over there is so fat.

In the later part of the middle stage, the person with dementia may speak haltingly and you may not be able to make sense of what they are trying to say. When the person is among strangers, it may be necessary for caregivers to explain to them what the person is saying and to convey what the others are saying to the person. You are acting as interpreter for both parties. Sometimes, people with Alzheimer’s begin to speak only the first language they learned earlier in life.

Late Stage – Gradually Lose Ability to Speak

They may make sounds or moans or facial expressions that give you a clue as to how they are doing. If you think that the person is uncomfortable, try to change their position, offer a drink, play music, or do whatever you think may bring them some comfort. Watch the response to your efforts to see if you are on the right track. Communicate your caring through gentle gestures.

TAKING CARE OF YOURSELF

Music Can Help

Music is used by specialized therapists to improve a person's physical and mental functioning. Singing, playing instruments, and moving or dancing to music can improve communication, motor skills, and mood. It can be a way caregivers can get enjoyment while benefiting the senior with AD. Music therapy provides:

- Memory recall for reminiscing
- Positive changes in mood and stress reduction
- Management of pain and discomfort without drugs
- Opportunities to interact socially with others

About Music

"I regard music therapy as a tool of great power in many neurological disorders - Parkinson's and Alzheimer's - because of its unique capacity to organize or reorganize cerebral function when it has been damaged."

- Oliver Sacks, MD

Patience is Important

One of the biggest challenges to caregivers of family members is to remain patient while coping with the changes or losses in communication. The challenge will increase as the disease progresses.

Don't Fall - Be Safe!

People with Alzheimer's disease are at a particularly high risk of falling. Problems with vision, perception, and balance increase as the disease advances, making the risk of a fall more likely.

"Whatever happens around you, don't take it personally...nothing other people do is because of you. It is because of themselves." - Miguel Ruiz

Community Wellness Classes

brought to you by the Area Agency on Aging District 7

**Chronic Disease Self-Management • Diabetes Self-Management
A Matter of Balance Falls Prevention • Tools for Caregivers**

Classes available throughout our ten-county district. Contact us to learn more about these FREE classes and when we will be in your area!

Safety Tips - *Agitation*

Mild agitation may seem like a personality change in which a person acts in ways that are uncharacteristic or inappropriate, such as being stubborn or nervous. Severe agitation can be disruptive or even dangerous. Agitated behavior can start in the early stage and grows worse in the middle stage of the illness.

An agitated person may be unable to sleep, pace constantly, move around restlessly, tearing paper, or even cursing or using threatening language.

People with Alzheimer's disease are less able to handle changes, uncertainty, and other situations that they could manage when they were well. Being in a strange place may cause agitation. Even a positive event, such as a wedding, can feel overwhelming and lead to agitation. If the person in your care has had a recent hospitalization or other major life change, expect to see some agitation.

If a person with dementia has recently become agitated for the first time or acts unlike their usual self, the first thing to look for is a medical or physical problem.
